

ExpertImage Version 7: Why Upgrade

ExpertImage v7 for ADERANT clients is here. Designed as the next generation of ATG's popular imaging solution, ExpertImage v7 takes imaging to a new level, continuing where QuickImage left off. Completely customizable, firms will now have the ability to tailor enterprise-wide imaging to meet specific needs and requirements. ExpertImage separates the image related data from the transaction data for smooth, seamless integration with the host systems. All back-end image acquisition processes have been streamlined for fast, low maintenance operation.

Upgrade to 7, and here is why:

Custom Data Views: Create any number of custom data views and inquiries. Generate reports quickly and take advantage of flexible filters to find the precise information you, your firm, or clients are looking for.

Customizable Interface: The open system design allows complete control of the user interface; rearrange the order of search fields, change terminology, even add or remove search fields – it's easily configurable by a local administrator.

Language Localization: Being able to provide search fields and result sets in the local language is critical in today's global economy.

Third Party Application Integration: v7 is based on version 2.0 of the .NET Framework; access to images can easily be extended to other applications.

Image Retrieval Options: Retrieve images using a desktop executable or as a browser application.

On Demand Image Loading: Give users the ability to drag and drop files into the system, use the file navigator to locate and load files, or initiate a batch load job from their desktop – all based on your security settings.

Active Directory Integration: Use existing Active Directory group security to control access to images.

Security Enhancements: Control access to administrative features using the Windows login name.

Performance Improvements: Access more images faster. The new n-tier architecture divides the work across the desktop and database server.

Enterprising Imaging: Integrates with any existing SQL-based system to further connect applications and provide seamless access to enterprise-wide imaging.

Easy Migration Path: Existing images are migrated as part of the upgrade process, or choose to run the v7 environment in parallel until you decide to make the upgrade permanent.
